¹Capacity factor for units available to be built in specified year. Capacity factor represents maximum expected annual power output as a fraction of theoretical output if plant were operated at rated capacity for a full year.

²Hydroelectric capacity factors are specific for each site. The table entries represent the least-cost unit available in the specified year in the Northwest Power Pool region.

³Wind capacity factors are based on regional resource availability and generation characteristics. The table entries represent the highest quality resource available in the specified year.
